Bug Report (Task 1)

The following test is done on the https://demo.realworld.show — public live demo. and verified the errors in the codebase

#	Title / Summary	Steps to Reproduce	Expected vs Actual	Severity	Suspected Cause
1	Empty article submission accepted	1. Log in 2. New Article 3. Leave title, description and body empty. 4. Publish.	**Expected:** Submission should be blocked with validation errors**.** **Actual:** Empty article is accepted and appears in the feed.	High	Missing required-field validators in the article editor form and no validation check before submission.
2	Whitespace-only article content is accepted	1. Log in. 2. Navigate to New Article. 3. Enter only spaces in the Title, Description and Body fields. 4. Click Publish Article.	**Expected:** Whitespace-only values should be rejected as invalid input. **Actual:** Automated component tests confirm that whitespace-only values pass validation and trigger submission.	Medium	Form validation does not check whether input contains meaningful, non-whitespace characters.
3	Empty article displays blank detail page	1.Create an empty article. 2. Locate it in the feed 3. Click Read More..	**Expected:** Article details or a meaningful validation/error message should appear. **Actual:** A blank white content area appears, while the header and footer remain visible.	High	Empty article data is not handled properly by the article detail rendering flow. Exact backend/slug behavior requires further verification.
4	Missing article slug displays a blank page	1. Open the application. 2. Navigate directly to /article without providing an article slug. 3. Observe the page.	**Expected:** Application should display a 404 page or redirect to a valid route. **Actual:** The router outlet remains blank instead of displaying an error or fallback page.	Medium	Missing route handling for an article URL without a slug and no appropriate fallback route.
5	Markdown pipe fails with null or undefined input	1. Open an article with missing or null body content. 2. Allow the Markdown pipe to process the content. 3. Observe the rendering behavior.	**Expected:** Markdown pipe should safely handle null or undefined input and return empty content. **Actual:** Unit tests show that the pipe throws when marked.parse() receives null or undefined.	Medium	Markdown pipe directly calls marked.parse(content) without checking for null or undefined values.
6	Edit and delete controls unavailable for empty article	1. Create an empty article. 2. Open its detail page. 3. Check for Edit and Delete controls.	**Expected:** The author should be able to manage their article or receive a clear error. **Actual:** Edit and Delete controls are unavailable.	Medium	Article details fail to load correctly, so the author permission controls are not rendered. Likely a consequence of Issue 3.
7	Article content disappears when comments API fails	1. Open an article. 2. Simulate HTTP 500 from comments API. 3. Reload.	**Expected:** Article content should remain visible even if comments fail. **Actual:** Mocked E2E test shows that article content does not render.	High	combineLatest() combines article and comments requests; the error handler returns EMPTY, preventing the combined stream from emitting.

Root-Cause Analysis: Article Creation Accepts Empty Fields

The application allows users to publish articles without providing a title, description, or body. This happens because the article editor form does not define required-field validators for these inputs. Additionally, the submitForm() method does not check whether the form is valid before submitting the article. As a result, even completely empty input is passed to the article creation request and accepted by the application. This leads to empty articles appearing in the global feed and creates an inconsistent user experience. To fix this issue, required validators should be added to all three form fields, along with checks that reject whitespace-only input. The submission handler should also verify form validity and prevent API requests when the input is invalid. Finally, appropriate validation messages should be displayed to guide users.
